Embryo Transfer Tips

If you have ever done flush work or plan to do flush work, please read the following most often ignored embryo transfer protocols.

Processing Flush Information

Flush information must be sent to the national office within 120 days to receive the lower processing fee of \$20. Flush paperwork received after 120 days will cost \$50.

All donor dams <u>must</u> be DNA or SNP tested before flush work or resulting offpspring registrations will be processed.

Transfer of Ownership

An application specific for transferring ownership of embryos is available on the Brown Swiss Association website. Embryo transfer applications should include both the full name and registration number of the donor dam (As do registrations).

The transfer fee should be paid by the seller unless prior arrangements have been made with the buyer. If sold through a consignment sale, generally, the sale manager will deduct the transfer fee from the consignor's check.

Embryos sold are required to be transferred, regardless of the implantation outcome.

All eggs in a single flush sold to one buyer on the same sale date are covered under one transfer fee.

If a cow is sold while carrying an embryo, both the cow **and** the embryo must be transferred.

Embryos Sold for Export

Embryos sold for export must be transferred and accompanied by a copy of the embryo identification sheet. For an export order, the application for embryo export (D Form) may be used in place of an individual embryo transfer application.

Registering ET/ETV Animals

When registering an ET/ETV animal, the specific embryo ID number must be indicated. (This is the only way to connect the animal with the correct flush.)

When registering an ET/ETV animal online, in the multiple birth drop-down box, select Embryo Transplant or IVF Embryo Transplant. This will automatically place ET or ETV at the end of the animal's name. (Do not manually type ET or ETV at the end of the animal's name.) Also select ET in the AI Service field in the lower section.

Remember if the embryo breeder has a registered prefix, the system will automatically place it in the name. If the prefix is not registered, it must be entered manually.

Once all the information is entered, click update.

Always verify the name which will appear below the name entry field to see if it is correct (check for no prefix, two prefixes, etc.) **before** you hit register.

If you realize you've made a mistake after clicking register, please do <u>not</u> submit the order. Call the office with the order number and problem so we can fix it before the order is closed, printed, and mailed.
